

On the problem of ontological commitments and how to address it

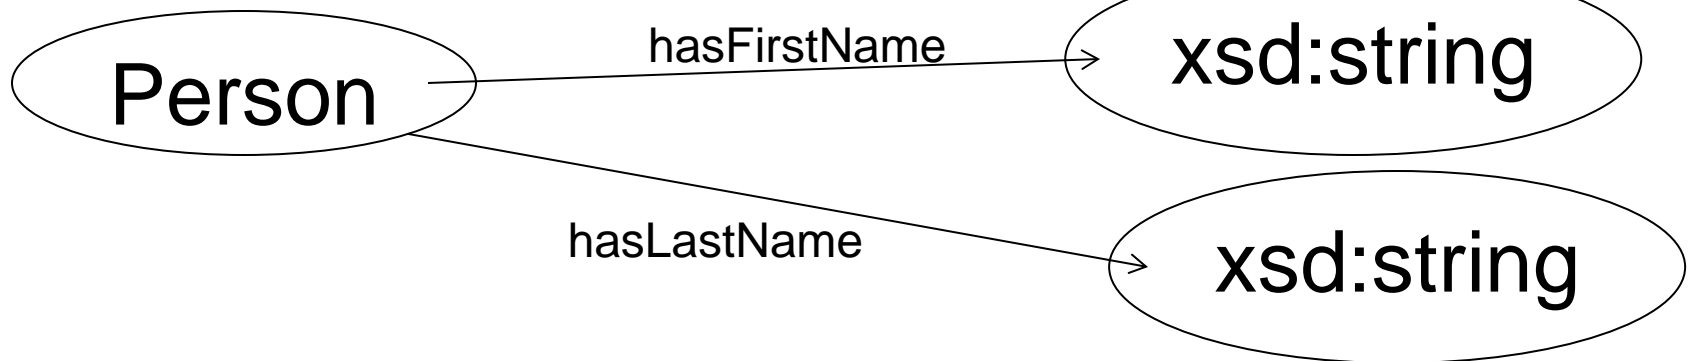

Pascal Hitzler

DaSe Lab for Data Semantics
Wright State University

“I need to sort by last name.”

“My name is “Artur d’Avila Garcez”. I’m Brazilian of Spanish descendency.

“My first name is Anna-Maria, but I live in the U.S. and the ID systems didn’t accept a hyphen in my name.

“My name is Pan Ji. What do you mean by ‘last name’?”

“My name actually changed recently ...”

a.k.a.

modeling choices you may regret later

I actually need to know the degree of certainty.

I don't need an uncertainty value, I need a probability distribution.

So with what device was that measured and when?

I'm working with historical data, how do I specify the prime meridian?

Whenever you decide on how to make your metadata

- **keyword annotation**
- **controlled vocabularies**
- **light-weight taxonomy**
- **full-blown ontology**

You always have to make specific modeling decisions.

You can either make detailed specifications (ontological commitments) which will often hinder reuse for new purposes.

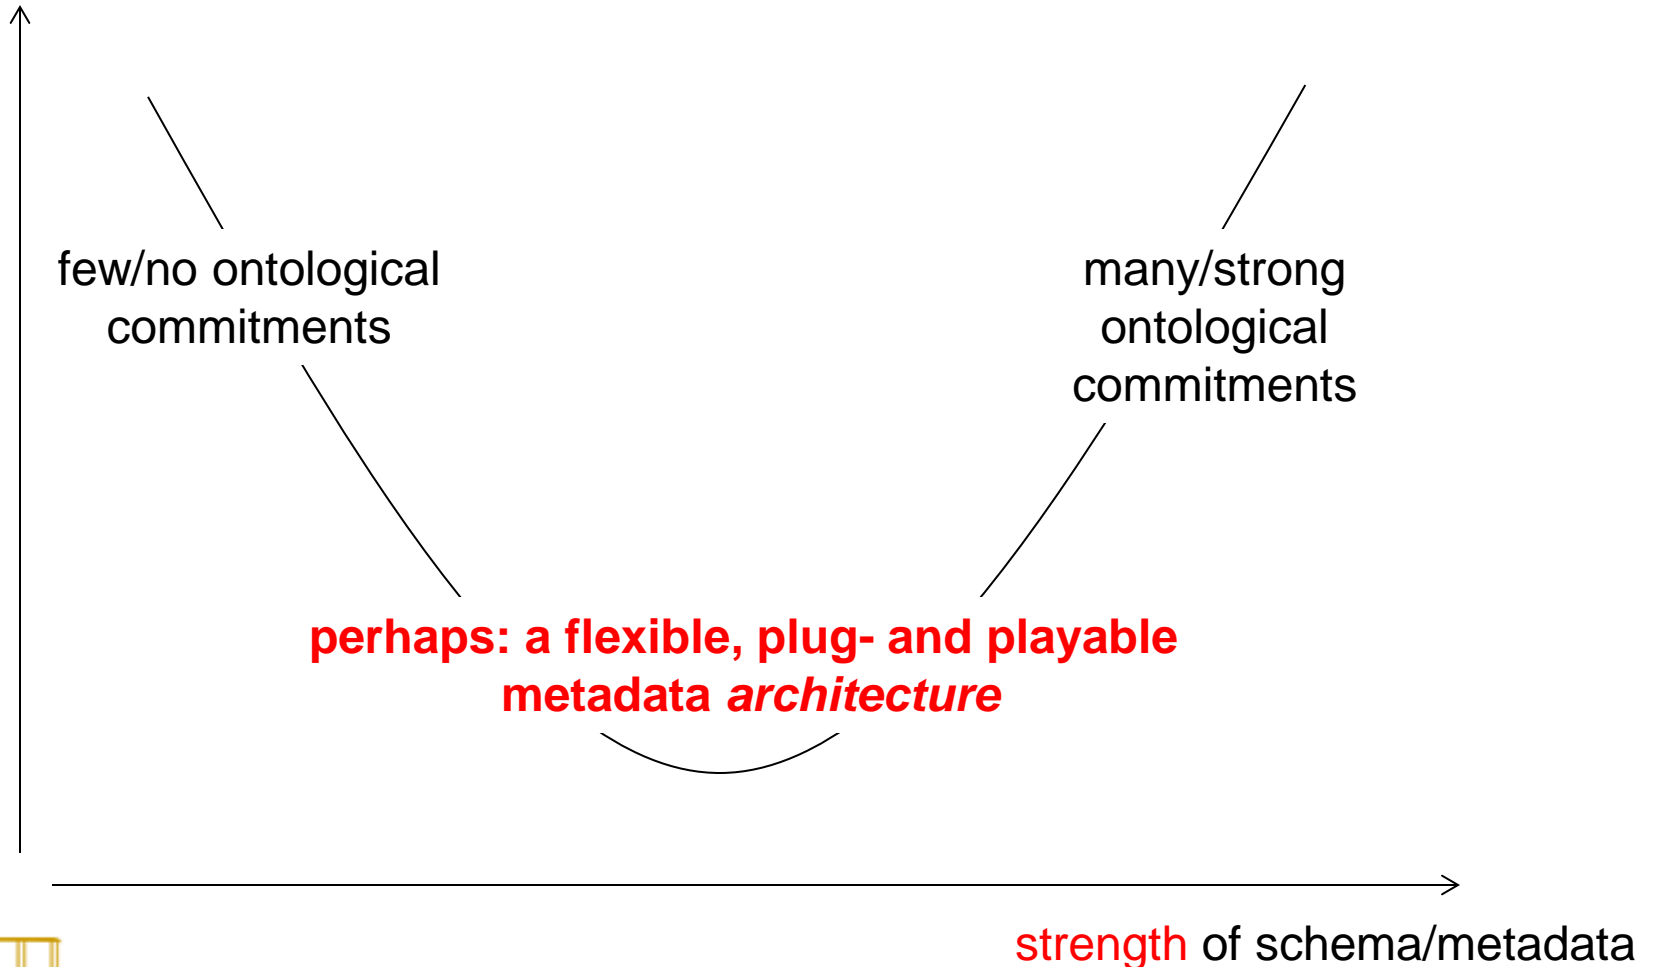

Or you can avoid the commitments, resulting in ambiguity which cannot really be resolved later, thus also hindering reuse.

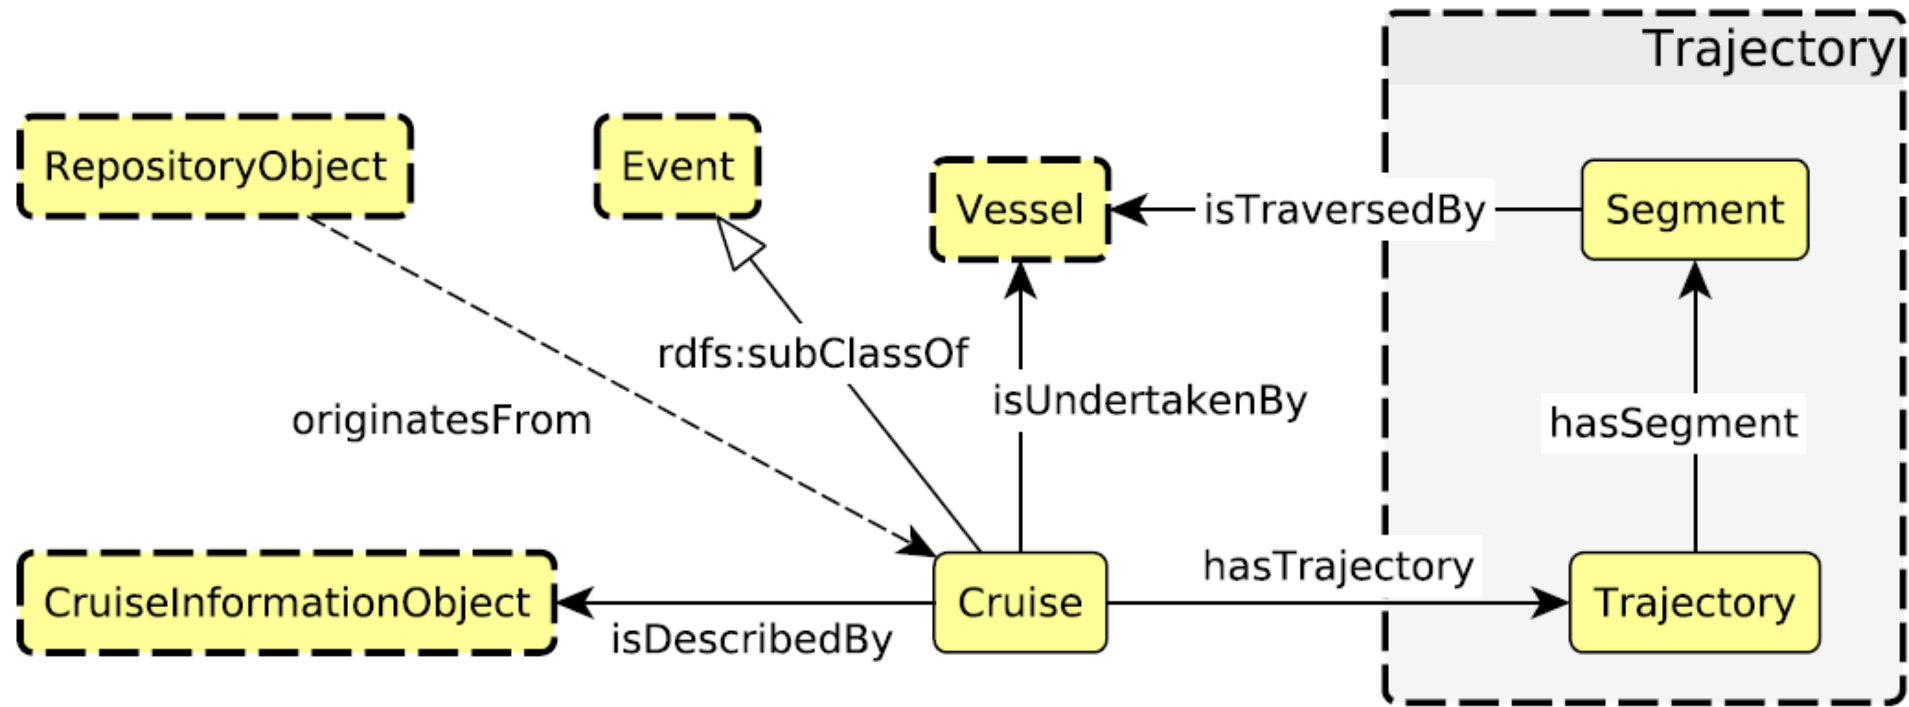

Soft Spot Search

cost of data integration and reuse

cost of data integration and reuse

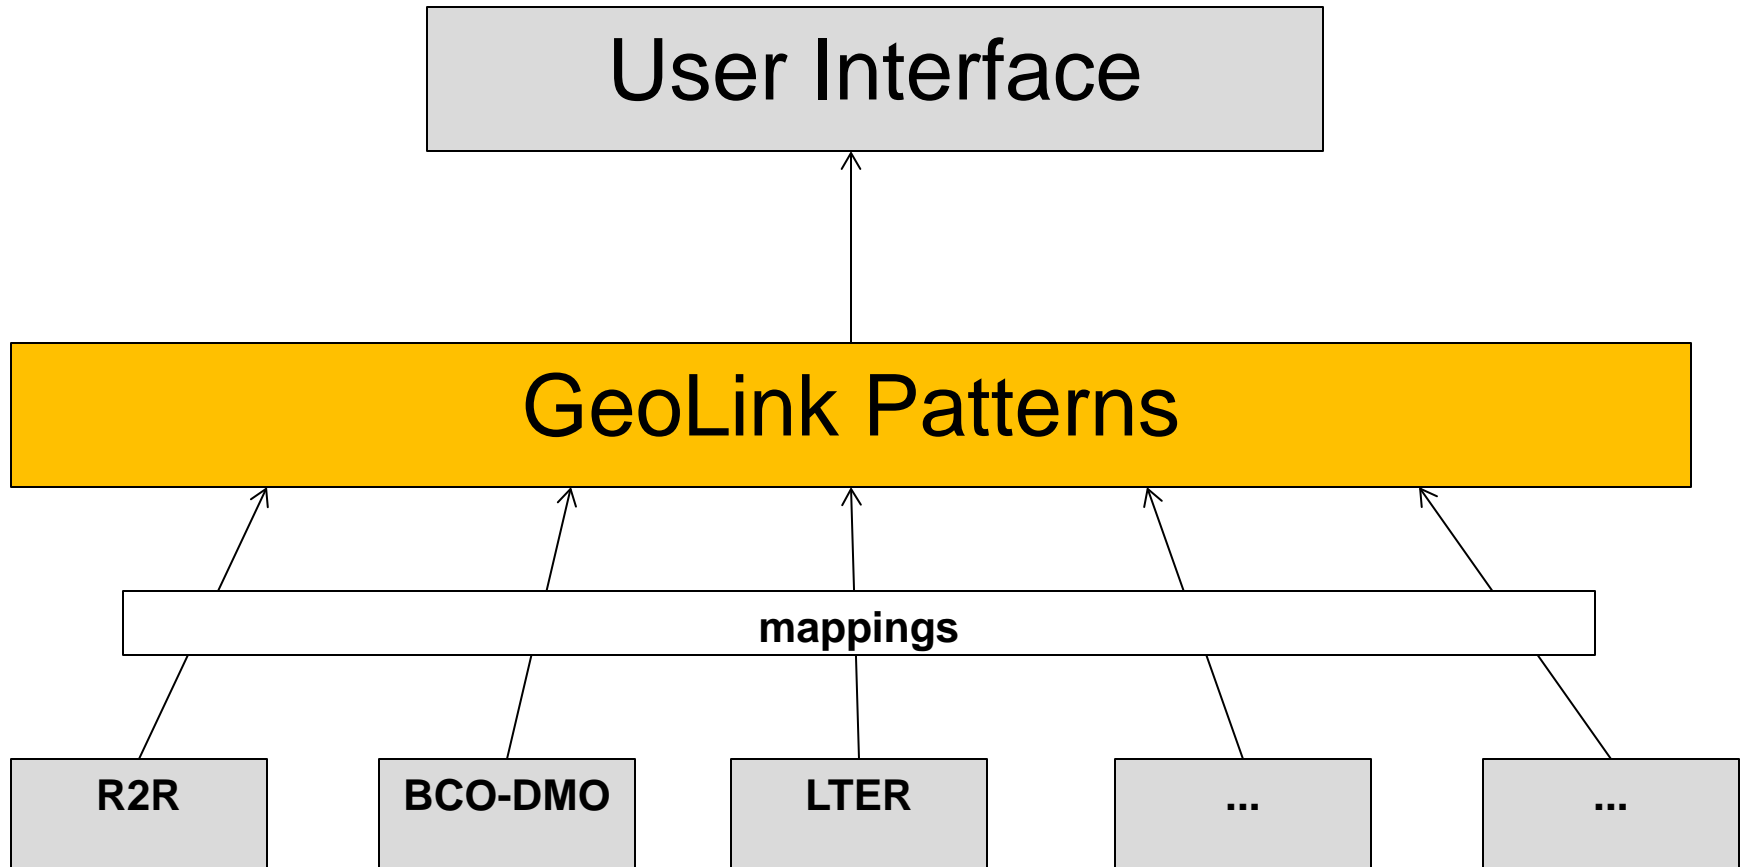

“An ontology design pattern is a reusable successful solution to a recurrent modeling problem.”

So-called *content patterns* usually encode specific abstract notions, such as process, event, agent, etc.

Patterns provide modular, reusable, replaceable, pieces.

Patterns can be configured as a flexible, modular, “plug-and-play” metadata ecosystem in which patterns can be exchanged as needed.

Thanks!

EarthCube requires

- information integration
- interoperability
- conceptual modeling
- intelligent search
- data-model intercomparison
- data publishing support

Semantic Web studies

- information integration
- interoperability
- conceptual modeling
- intelligent search
- data-model intercomparison
- data publishing support

The EarthCube “Architecture” must be

- modular
- extensible
- sustainable
- sliceable (i.e. you can adopt part of it without adopting all)
- simple enough for easy adoption
- complex enough to solve real problems
- scalable in terms of breadth of topic coverage
- elastic, in that it allows partners to decide how much they want to share
- respectful of individual modeling choices

Roles (Cruise as Event)

We show that our approach meets the mentioned EarthCube challenges, by significantly extending depth and breadth of topic coverage
